VertiCool Condenser Filter Box

There are applications where the air quality for the condenser air would not be the best for the condenser coil. This might be in an industrial application inside the facility or possibly a facility where dust is prevalent outside.

Shown here is a VertiCool unit with a condenser filter box option. The standard filters are 2", MERV 8. Please contact United CoolAir if another filter efficiency level or type is required.

But that is not all...

Please also keep in mind that other options might also be in order to help protect the condenser coil. The coils can be coated with Electrofin or Heresite. If the units will be exposed to salt air or perhaps a caustic environment, the coated coil option would be desirable.

It should also be noted that in some situations, the cabinets have also been coated.

And it doesn't stop there...

Recently a project had specified a Fins Per Inch (FPI) requirement. Engineering analyzed the performance and found that it would be acceptable for that specific application design. The customer was able to close the order because United CoolAir could satisfy the customer requirements.

The condenser filter box and protective coil coatings are not limited to just the VertiCool product lines, it is also available on the other product lines as well.

When you have that unique application please keep United CoolAir in mind.

Give us a call and we should be able to respond quickly as to what might be possible as the best option. It may be just enough to block out any competition.
